INTRODUCTION

Because the latitude E6400 has just one screw to remove to access the upgradable guts, this process takes no more than 20 minutes to do. It's also very easy.

 - [Arctic Silver Thermal Paste](#) (1)

Step 1 — Heatsink & Thermal Paste

- Simultaneously slide the battery latches (outlined by the red box) to the dock connector in the middle.
- This will release the battery. Just slide the battery away from the computer.
- Remove all screws and slide the panel off the laptop.

Step 2

- Pull the fan cable straight away from its socket.

Step 3

- Loosen screw 1
- Do not completely loosen a screw.
- Loosen each screw a little bit. Going from 1 then to 2 then to 3 and then to 4. Keep doing this until they are all loose.
- Loosening one completely with out the other screws loosened may damage the logic board
- Lift the heatsink up, until it won't rise any farther.
- Pull the heat sink out.

Step 4

- Using cotton swabs, clean off the old thermal paste off the die of the CPU and the heat sink.
- Use the strongest isopropyl alcohol you can find.
- You want to dip the cotton swabs into the alcohol and clean off the paste.
- Keep doing this until the white cotton remains white. this indicates it is as clean as possible.
- Dry the heat sink and die with another cotton swab. Make sure than none of the carbon fibers are left on the die or copper plating.

Step 5

- And screw the screws in securely.
- You want it tight, but not too tight because you will crack the logic board rendering it useless.

Step 6

- Slide the back cover on.
- Screw the screw in.
- Pop the battery back in.
